

**Hook Tool.**

The hook tool is designed to provide a penetrating spray inside a cavity. It is particularly suitable for applications where it is rotated whilst spraying, to provide a 360 degree application.

**Flexible tube.**

The flexible tube is designed to be fed into a cavity, the tube is then withdrawn slowly whilst the trigger of the compact service tool is operated to apply the product. Care should be exercised when the tube emerges from the cavity, to avoid possible overspray.

**Rigid lance.**

The rigid lance is designed for applications where a long reach is required e.g. inside door cavities. The lance should be withdrawn slowly whilst the trigger of the compact service tool is operated to apply the product. Care should be exercised when the tube emerges from the cavity, to avoid possible overspray.
